Security considerations assessment

ProtectUK publication date

23/11/2021

Implementing the SCA should lead to fewer security-related changes being required at a later stage. It also reduces the chance of repeating mistakes that may have compromised security in the past.

The SCA process should be used by those who are accountable and responsible for actions across the built environment. These includes activities such as planning, design, construction and manufacturing. It can also be used by organisations who wish to embed security-mindedness, or protect their commercial information, personal data and intellectual property.
