

Windows and glazed facades

ProtectUK publication date

23/11/2021

Windows and glazed facades comprise of a number of components and their security resistance is linked to how these components perform as a system, such as glass, seals, frame, connection to structures, hardware. The specification of these components will relate to the level of protection required, and not just the glass.

There are various types of glass available with different properties such as laminated, annealed/float, toughened, heat strengthened, laminated sandwiches and polycarbonate glass.

Laminated glass is the preferred option for most security applications. However, anti-shatter film and bomb blast net curtains may be used in conjunction with any type of glazing.
