

Active access delay systems

ProtectUK publication date

24/11/2021

Active access delay systems seek to disorient and delay attackers.

As part of a layered system of physical security for a facility, the use of active access delay systems might be considered. Active access delay systems seek to disorient and delay attackers. The increased delay to attackers will help:

- protect the site(s) asset(s);
- give people more time to seek safety; and
- provide greater opportunity for a response force to interdict an attacker.
